

Modeled Estimates of the Effects of Screening: Results from the CISNET Breast Cancer Consortium

International Breast Cancer Screening Network Biennial Meeting

Kathleen Cronin

Statistical Research and Applications Branch

National Cancer Institute

May 12, 2006

What Is CISNET?

- NCI Sponsored Consortium of Modelers Focused on
 - Modeling of the Impact of Cancer Control Interventions on Current and Future Population Trends in Incidence and Mortality
 - Optimal Cancer Control Planning
- 15 funded grantees in Breast, Prostate, Colorectal, and Lung Cancer
- Comparative modeling approach
 - Base Cases are joint modeling exercises

Breast Cancer Investigators in CISNET

Dana Farber - Marvin Zelen

Sandra J. Lee, Hui Huang, Rebecca Gelman

Erasmus University – Dik Habbema

Sita Y.G.L. Tan, Gerrit J. van Oortmarsen, Harry J. de Koning, Rob Boer

Georgetown University – Jeanne Mandelblatt

Clyde B. Schechter, K. Robin Yabroff, William Lawrence, Bin Yi, Jennifer Cullen

MD Anderson – Donald Berry

Lurdes Inoue, Mark Munsell, John Venier, Yu Shen, Greg Ball, Emma Hoy,
Richard L. Theriault, Melissa Bondy

Stanford University – Sylvia Plevritis

Bronislava Signal, Peter Salzman, Peter Glynn, Jarrett Rosenberg, Sanatan Rai

University of Rochester – Andrei Yakovlev

Alexander V. Zorin, Leonid G. Hanin

University of Wisconsin – Dennis Fryback

Marjorie A. Rosenberg, Amy Trentham-Dietz, Patrick L. Remington,
Natasha K. Stout, Vipat Kuruchittham

National Cancer Institute

Eric J. Feuer, Kathleen A. Cronin, Angela Mariotto

Cornerstone Systems Northwest

Joint Analysis of the Seven CISNET Groups: Breast Cancer Base Case

What is the Impact of Adjuvant Therapy and
Screening Mammography on US Breast
Cancer Mortality: 1975-2000 ?

Publications

Berry et al. *N ENGL J MED* 2005;353:1784-1792

JNCI Monograph due out summer 2006

- Common inputs
- Model descriptions
- Comparisons of
 - Modeling assumptions
 - Intermediate outcomes
 - Mortality outcomes

Population Models

Common Inputs

Background trends

Screening behavior

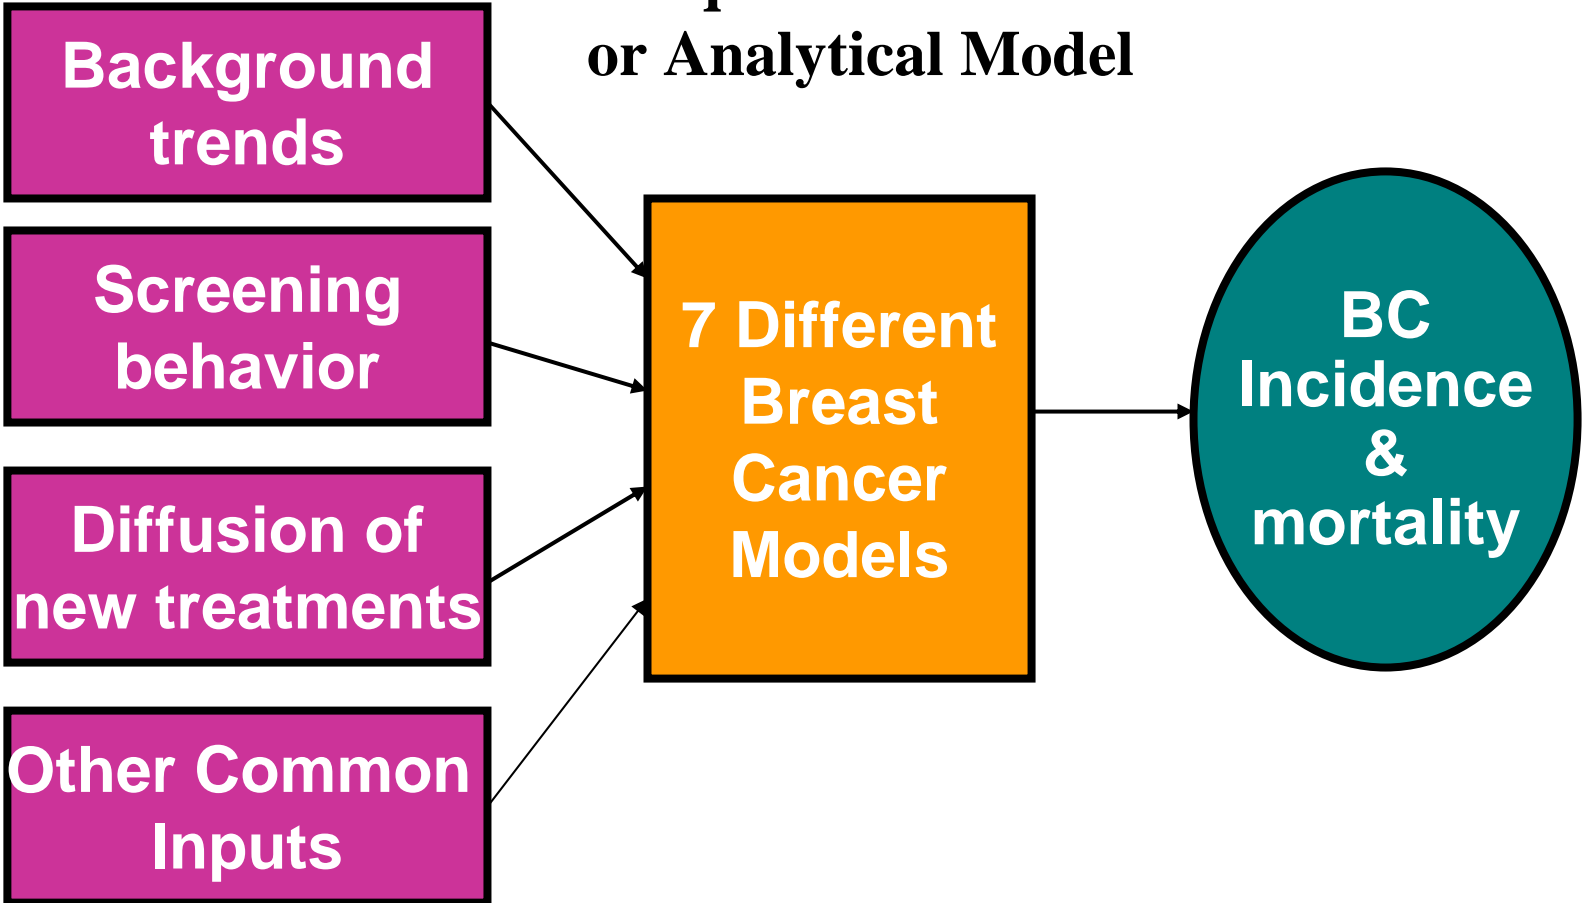

Diffusion of new treatments

Other Common Inputs

Unique Simulation or Analytical Model

7 Different Breast Cancer Models

BC Incidence & mortality

Common Inputs

Background Trends In Incidence

What would incidence have looked like without mammography screening?

Modeled incidence as a function of age, calendar period and birth cohort using historical Connecticut and SEER registry data.

- Assume that the “calendar period” effect reflects screening
 - Age-Period-Cohort represent that observed data points
 - Age-Cohort represents incidence without screening
- JNCI Monograph

Connecticut Breast Cancer Incidence By Age Group

SEER Breast Cancer Incidence By Age Group Weighting for SEER

Screening Behaviors

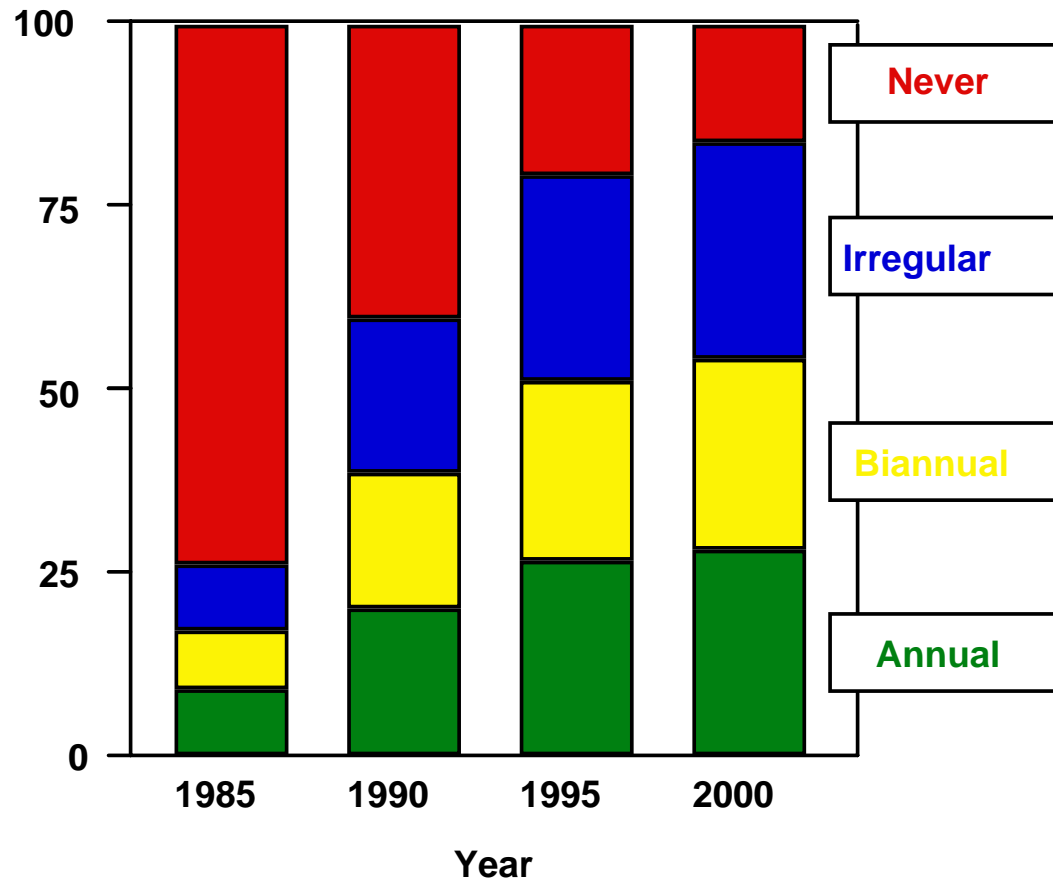

How much screening is there between 1975 and 2000?

- Developed a simulation program that would generate screening histories over the course of a woman's lifetime
 - Modeled the age of first screen using survey data
 - Modeled repeat screening behaviors using longitudinal data from the breast cancer surveillance consortium

Cronin et al. The Dissemination Of Mammography In The United States. *Cancer Causes Control* 2005;16:701-712.

Program posted on CISNET site under Input Parameter Generator Interfaces (<http://cisnet.cancer.gov/>)

Modeled Mammography Screening Over Time, Women age 40-79

Diffusion Of Adjuvant Chemotherapy and Tamoxifen

What is the usage of adjuvant chemotherapy and Tamoxifen by calendar year, age, stage and ER status?

- Modeled the use of adjuvant therapy using SEER patterns of care studies and SEER treatment information
 - Mariotto et al. Trends in use of adjuvant multi-agent chemotherapy and Tamoxifen for breast cancer in the United States: 1975-1999. J Natl Cancer Inst 2002;94:1626-34.
 - Updates in to include ER status in JNCI monograph

Dissemination of Adjuvant therapy

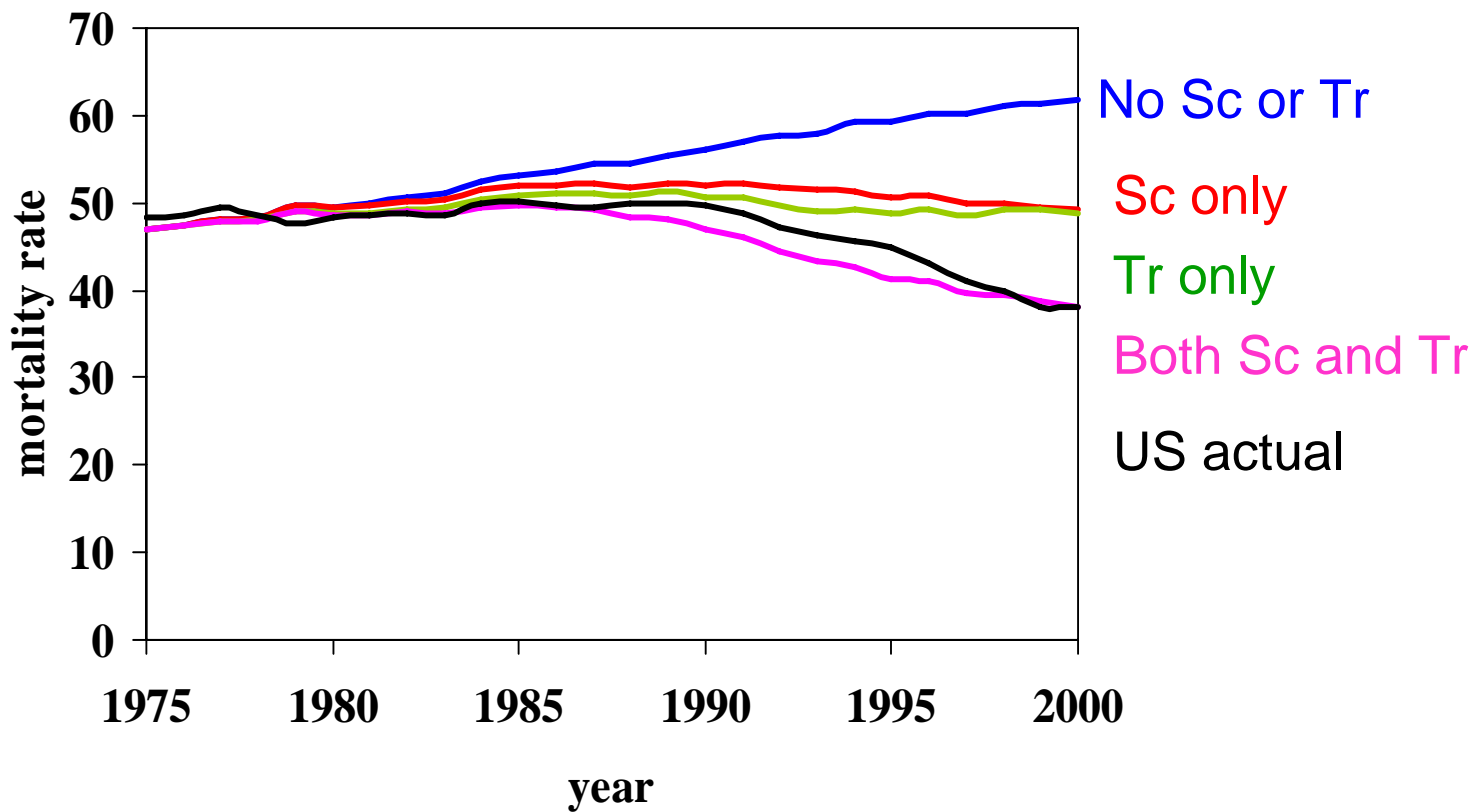

Women age 50-69 with node positive stage II or IIIA

Modeling Results

Model Runs From One Group

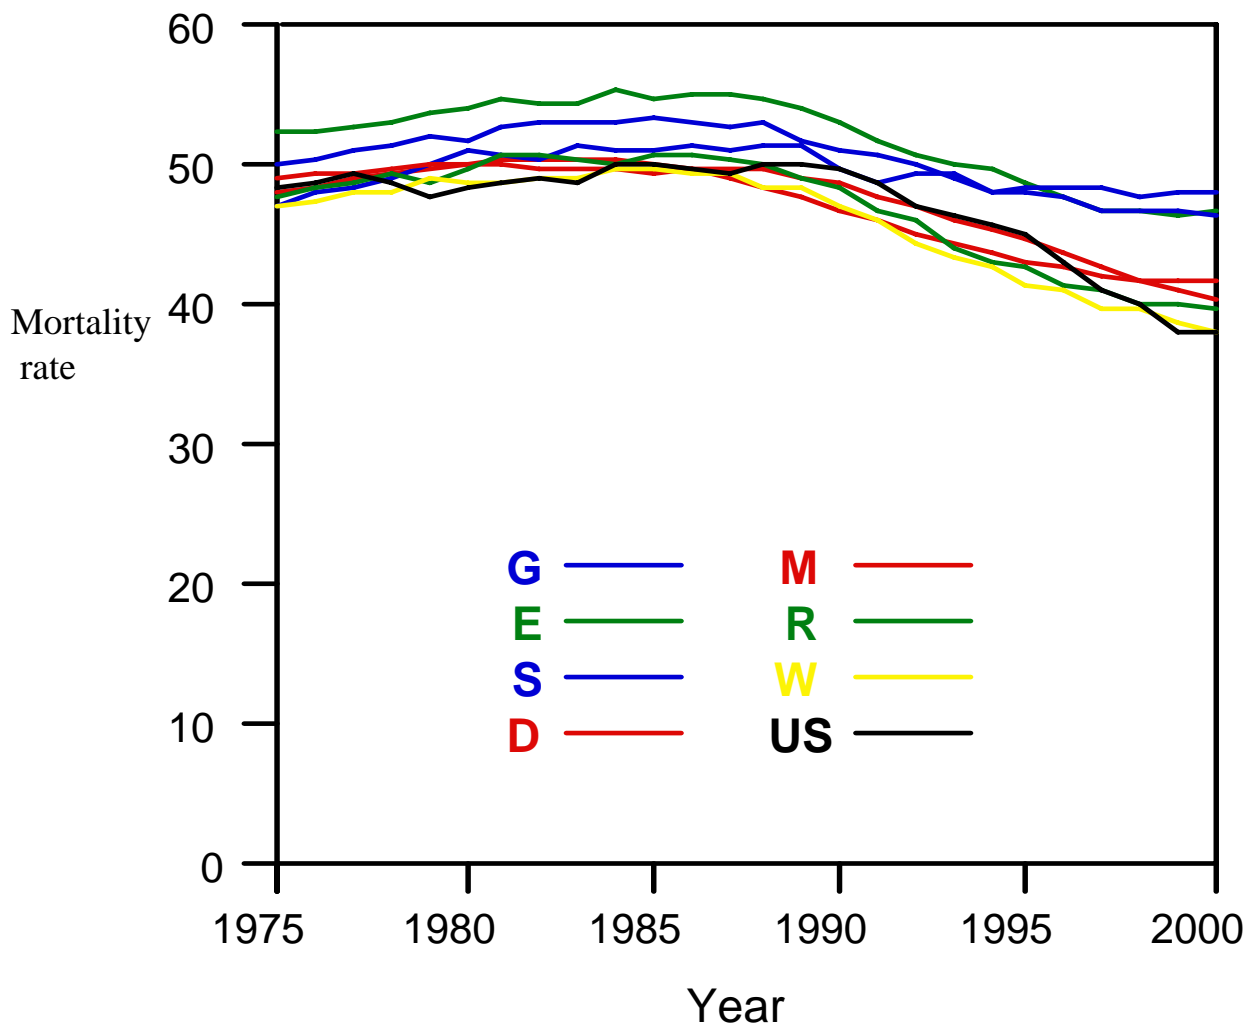

Mortality Rates For Women 40-79 Under Various Modeling Scenarios

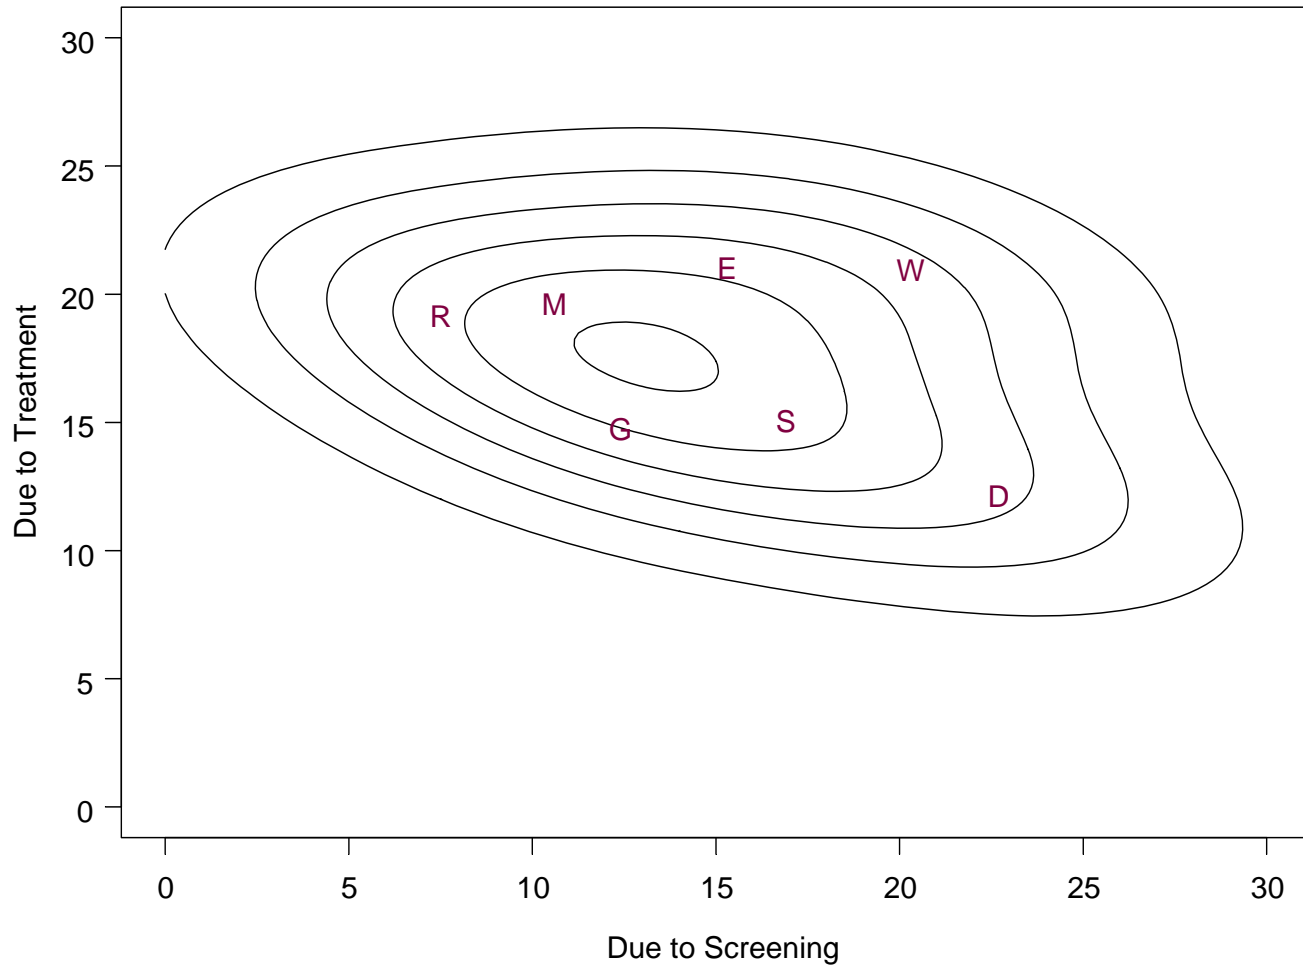

Modeled Mortality For Women Age 40-70 Without Screening Or Adjuvant Treatment

Modeled Mortality For Women Age 40-70 With Screening and Adjuvant Treatment

Estimated percent decline in mortality due to screening and adjuvant therapy for the 7 models

Conclusions and Press Coverage

- **Mammograms Validated as Key In Cancer Fight (New York Times)**

Conclusions and Press Coverage

- Mammograms Validated as Key In Cancer Fight (New York Times)
- Mammography in question: Benefits of breast cancer screening may be small, researchers say (Chicago Tribune)

Conclusions and Press Coverage

- Mammograms Validated as Key In Cancer Fight (New York Times)
- Mammography in question: Benefits of breast cancer screening may be small, researchers say (Chicago Tribune)
- **Statistical Blitz Helps Pin Down Mammography Benefits - “An unprecedented statistical assault” (CNN – medpage today)**

Conclusions and Press Coverage

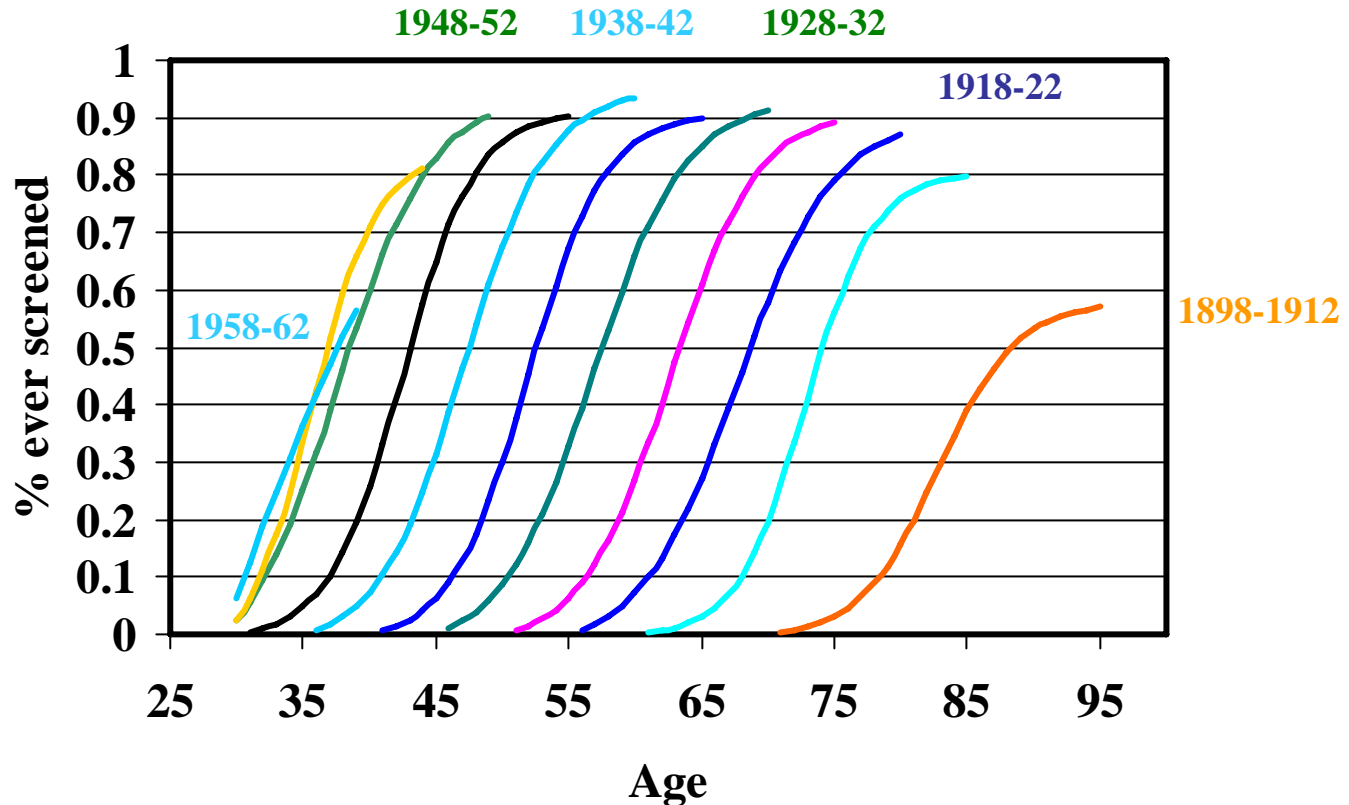

“What seems most important is that each team found at least some benefit from mammograms. The likelihood that they are beneficial seems a lot more solid today than it did four years ago, although the size of the benefit remains in dispute”

New York Times Editorial

Future Work

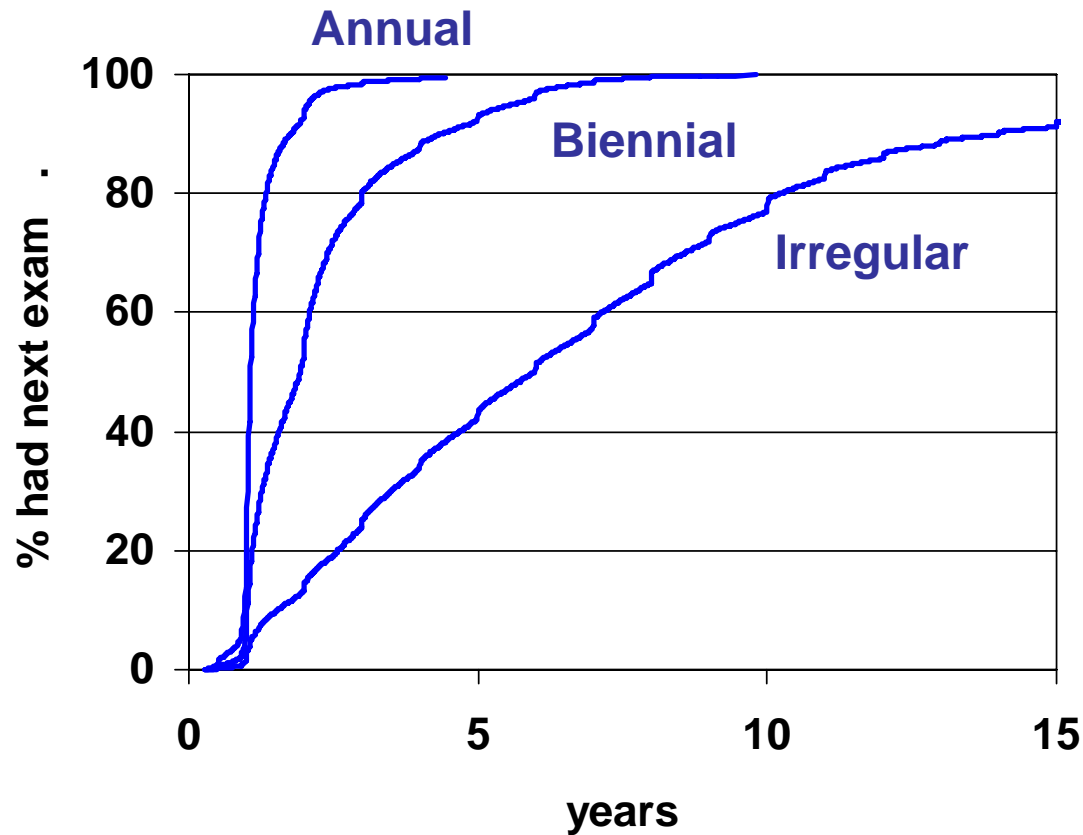

- Individual groups are working modeling risk factors and impact on cancer incidence.
- Optimal screening schedules for the population and for high risk groups.
- Factors influencing disparities.
- Several groups are participating in modeling progress toward HP2010 goals.
- A base case II – Modeling the impact of new treatments on population breast cancer mortality rates.

Age of First Mammography Screening By Birth Cohort

Based on a series of NHIS surveys

Time Between Subsequent Screening Exams For Women age 50-59

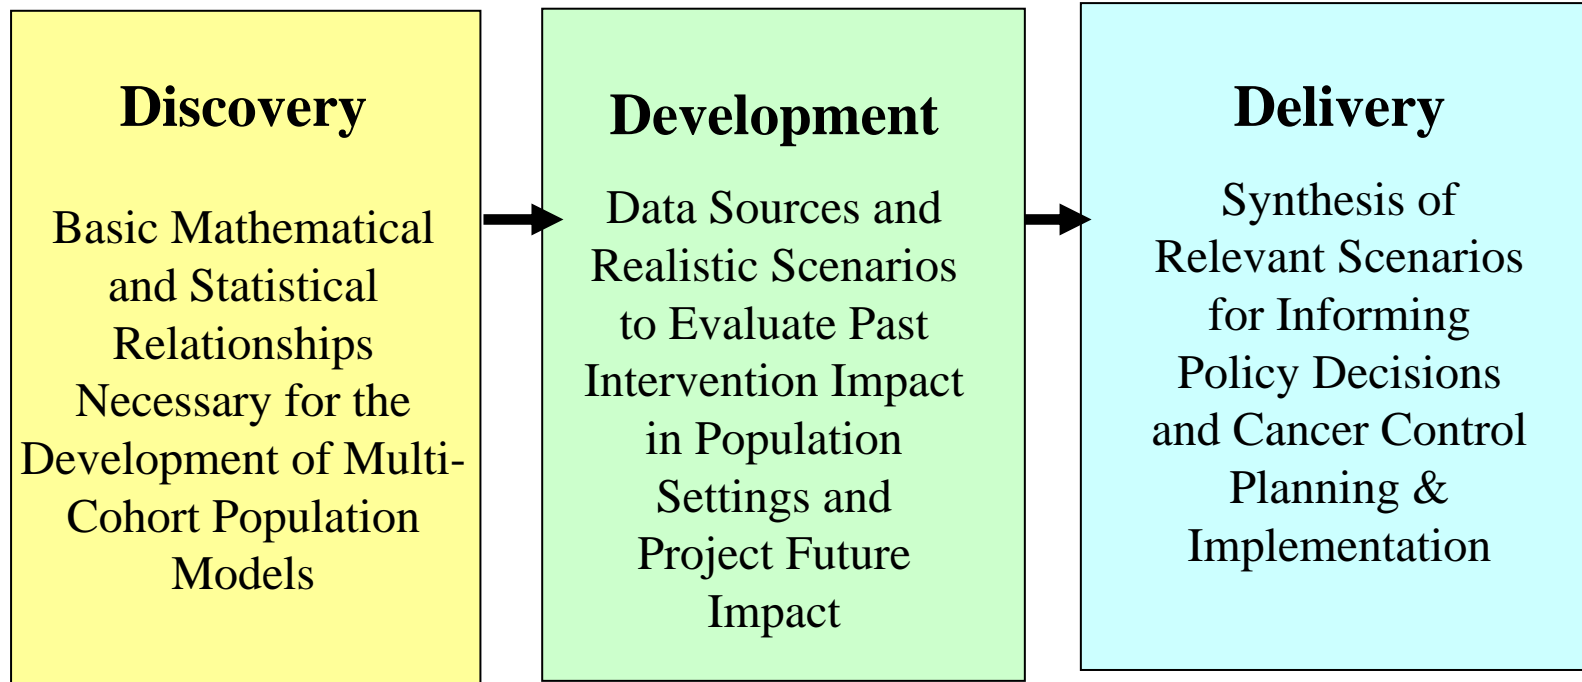

Based on data from the Breast Cancer Surveillance Consortium

Classification Of Screening Type By Age

Based on data from the Breast Cancer Surveillance Consortium
