Evaluation of Universal Population-based Stool-based Screening

Evidence-based Support
 Low-----High
 + ++ +++

Pros and Cons		
Benefits	Mortality reduction (+++)	Incidence (++)
Possible Harms	Negligible Overdiagnosis of CRC (++)	Overdetection of Adenoma (Not well-studied)

Evaluation of Universal Population-based Stool-based Screening

Evidence-based Support
 Low-----High
 + + + + + +

Pros and Cons

Benefit

Mortality reduction
(+++)

Incidence
(+)

Harm

Negligible
Overdiagnosis of
CRC (++)

Overdiagnosis of
Adenoma
(Not well-studied)

Minnesota Trial

Mortality Reduction
33%
(13%-50%)

Denmark Trial

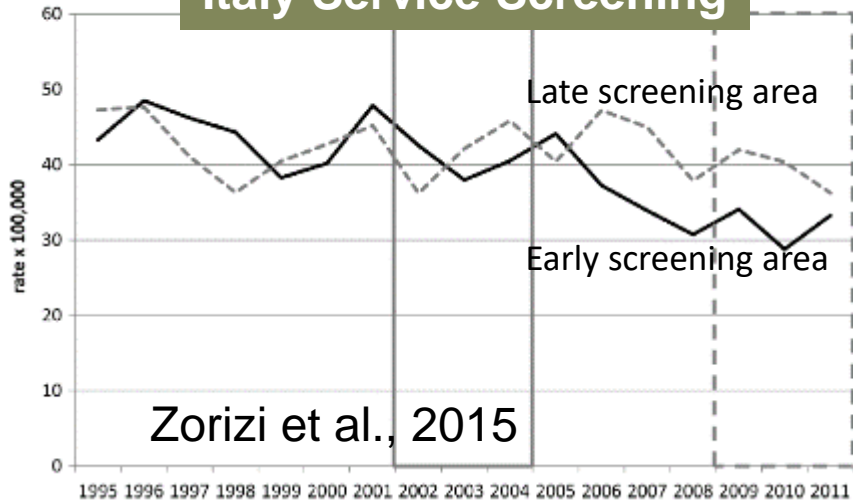

18%
(1%-32%)

Hardcastle Trial

15%
(2%-26%)

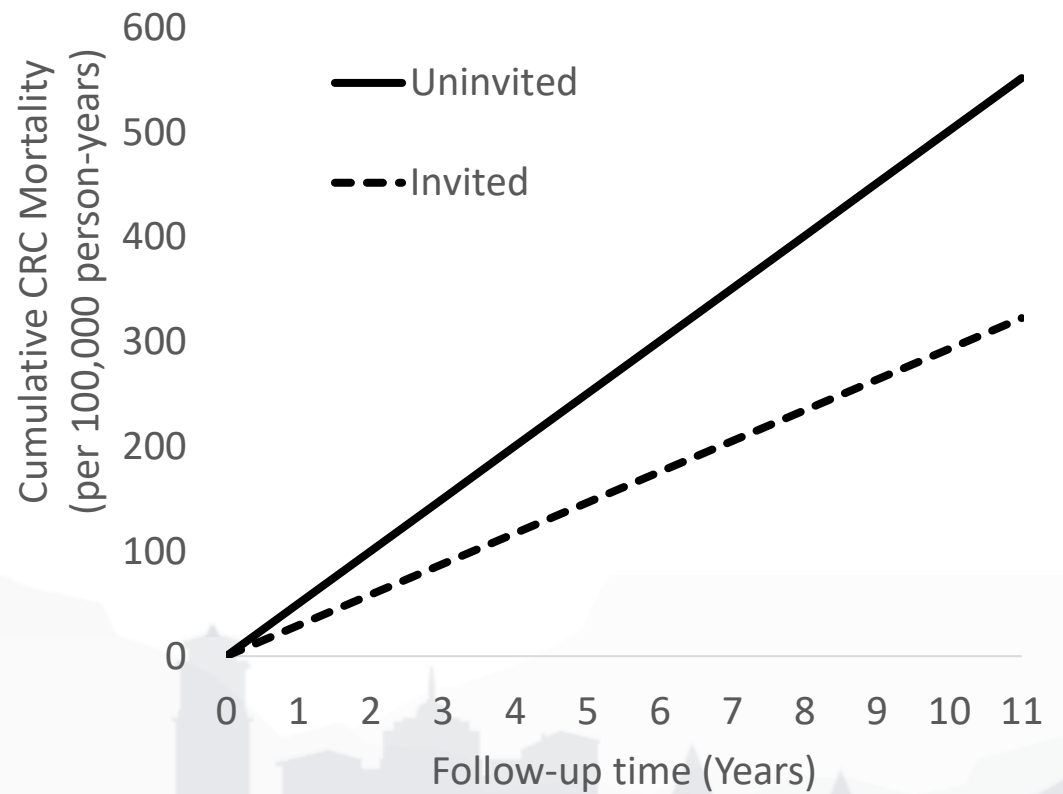

Universal Population-based FIT CRC Screening

Italy Service Screening

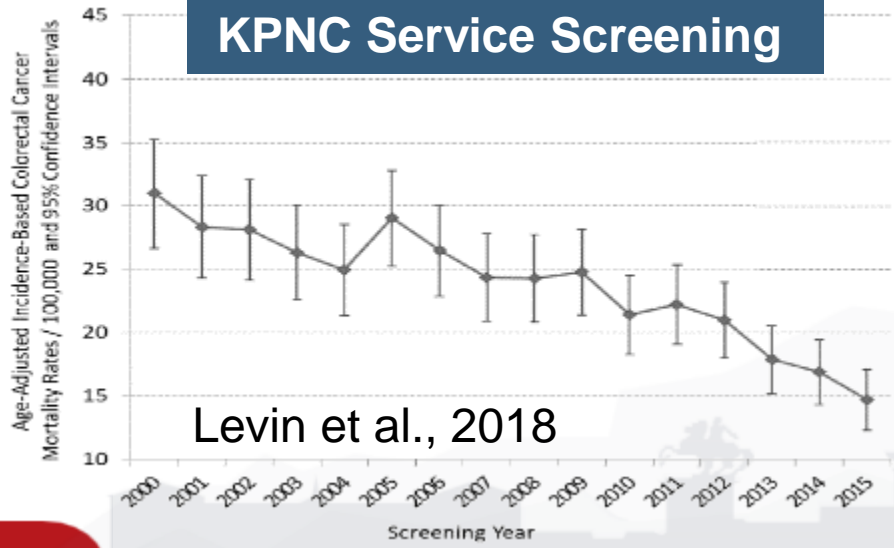

Mortality Reduction
22%

Taiwanese nationwide biennial FIT screening for colorectal cancer

Mortality reduction by **40%**

KPNC Service Screening

Mortality Reduction
52%

Overdetection of Colorectal Cancer

Pros and Cons		
Benefit	Mortality reduction (+++)	Incidence (+)
Harm	Negligible Overdiagnosis of CRC (++)	Overdiagnosis of Adenoma (Not well-studied)

Assessing overdiagnosis of fecal immunological test screening for colorectal cancer with a digital twin approach

Ting-Yu Lin^{1,7}, Sherry Yueh-Hsia Chiu^{2,3,7}, Ling-Chun Liao⁴, Sam Li-Sheng Chen⁵, Han-Mo Chiu^{6,8,9} and Tony Hsiu-Hsi Chen^{1,8,9}

Taiwan Service Screening

The percentage of overdiagnosis of colorectal cancer is **10%**

Challenges for Evaluating CRC Incidence Reduction and Overdiagnosis of Colorectal Adenoma?

1 Incidence Reduction

Colorectal Adenoma Rate

A mixture of progressive and over-detected adenoma

Solution

Digital Twin Design

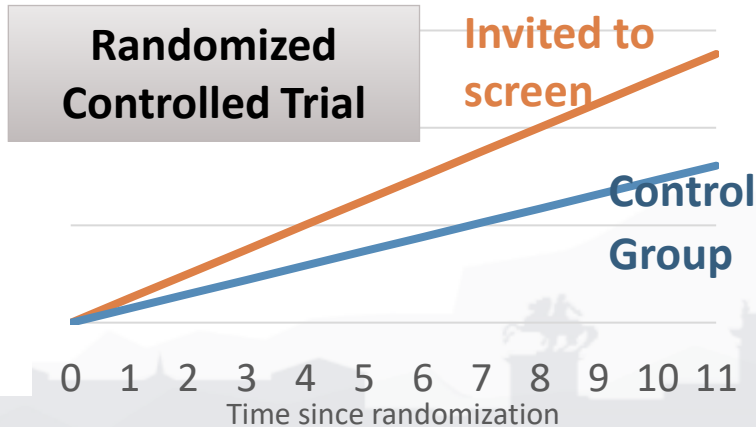

The Screen Arm

The Virtual-created Control Group (The Digital Twin)

2 Overdetection of Adenoma

Colorectal Adenoma Rate

Control group is difficult to estimate colorectal adenoma rate

Subsidiary Issues of Universal Screening

Good example

- **Inter-screening Interval**

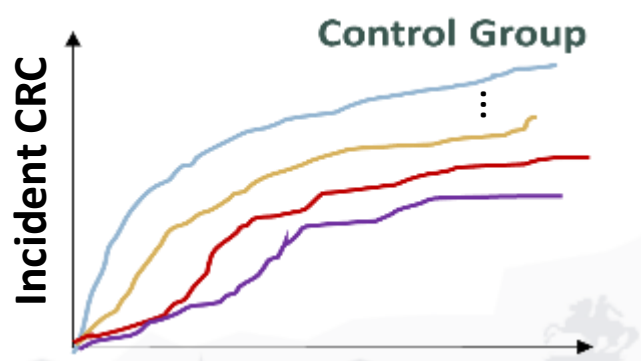

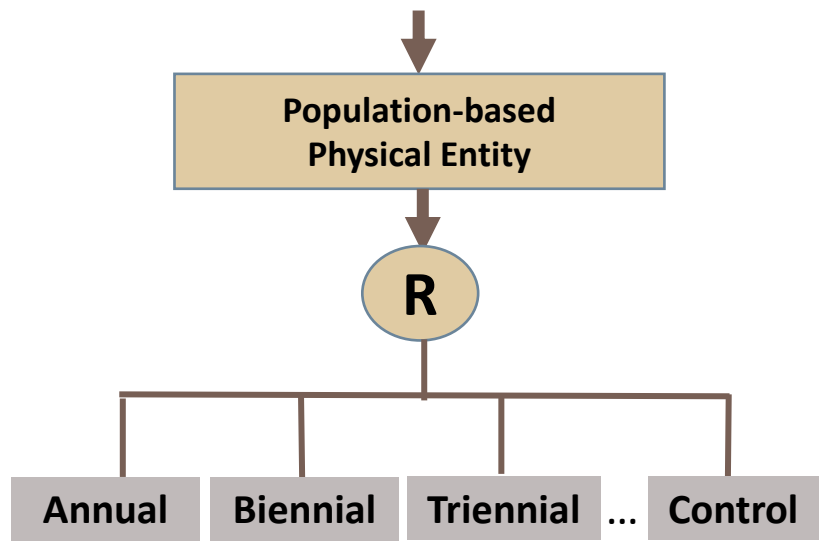

Risk-spectrum

Percentile of Risk Score
95-100
90-95
80-90
70-80
60-70
50-60 (Average Risk)
40-50
30-40
20-30
10-20
5-10
0-5

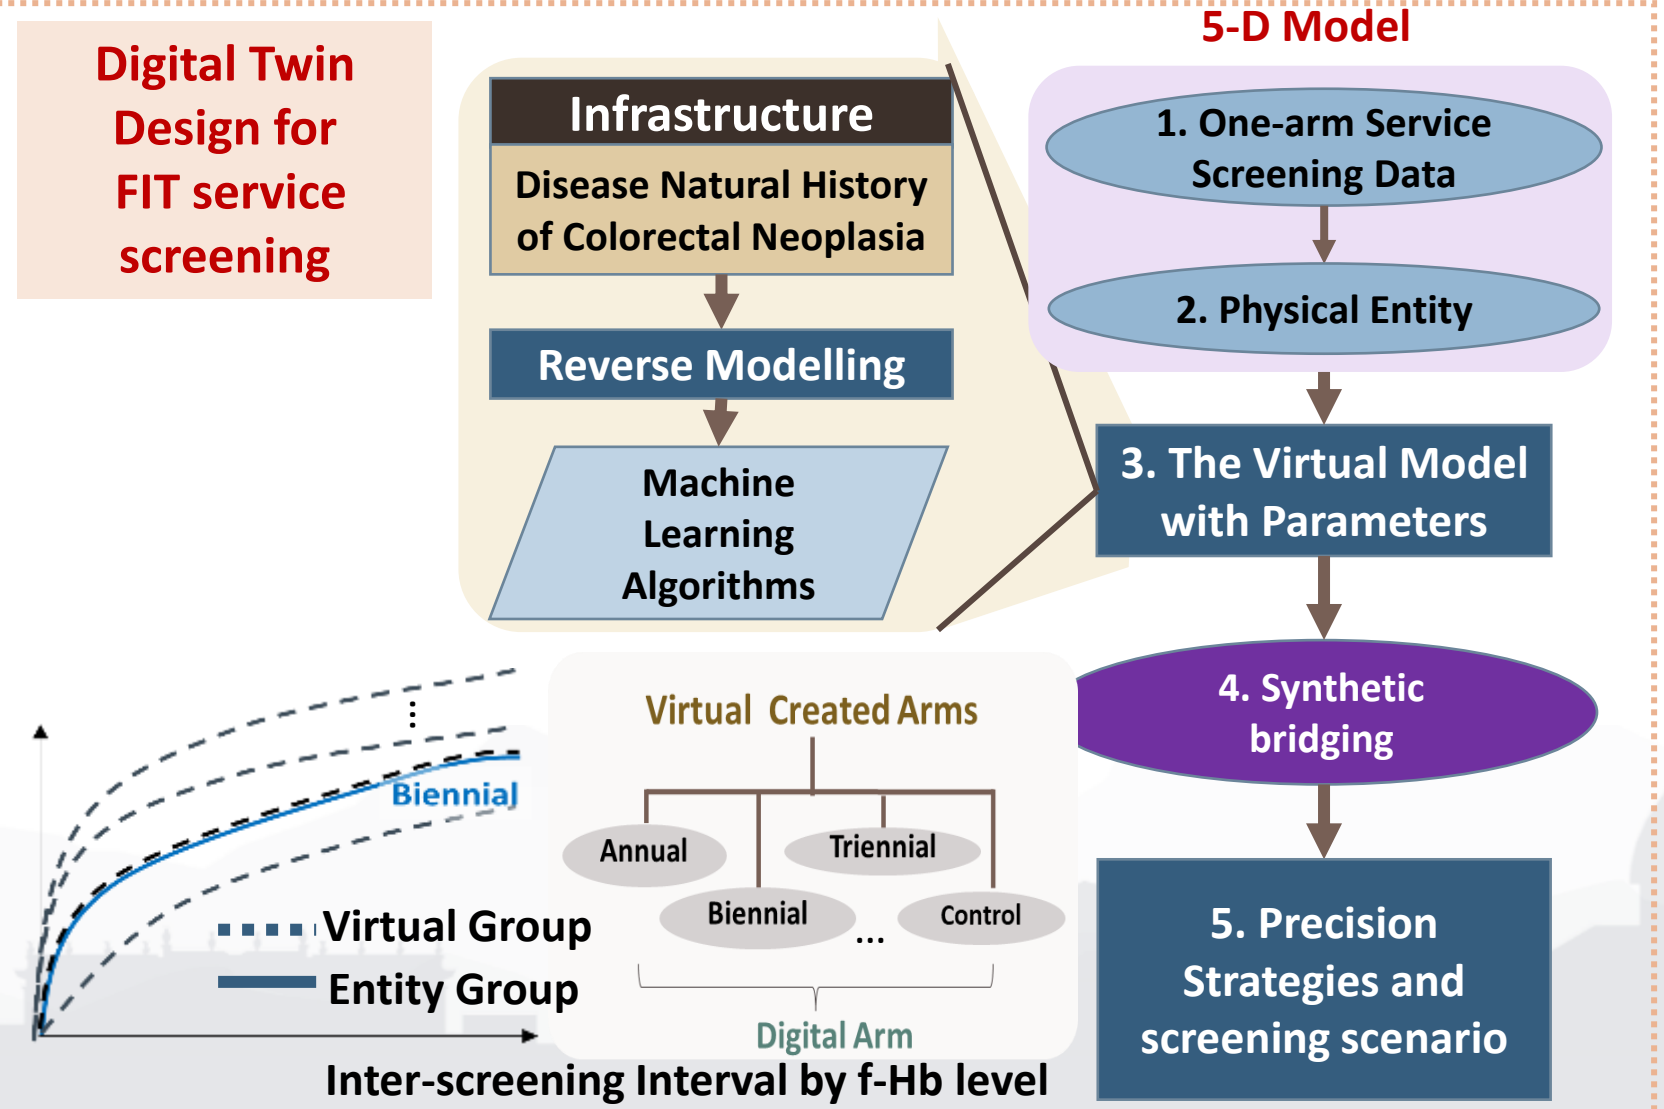

RCT vs Digital Twin Design for Impacts of Inter-screening Interval on Incident CRC

RCT Design

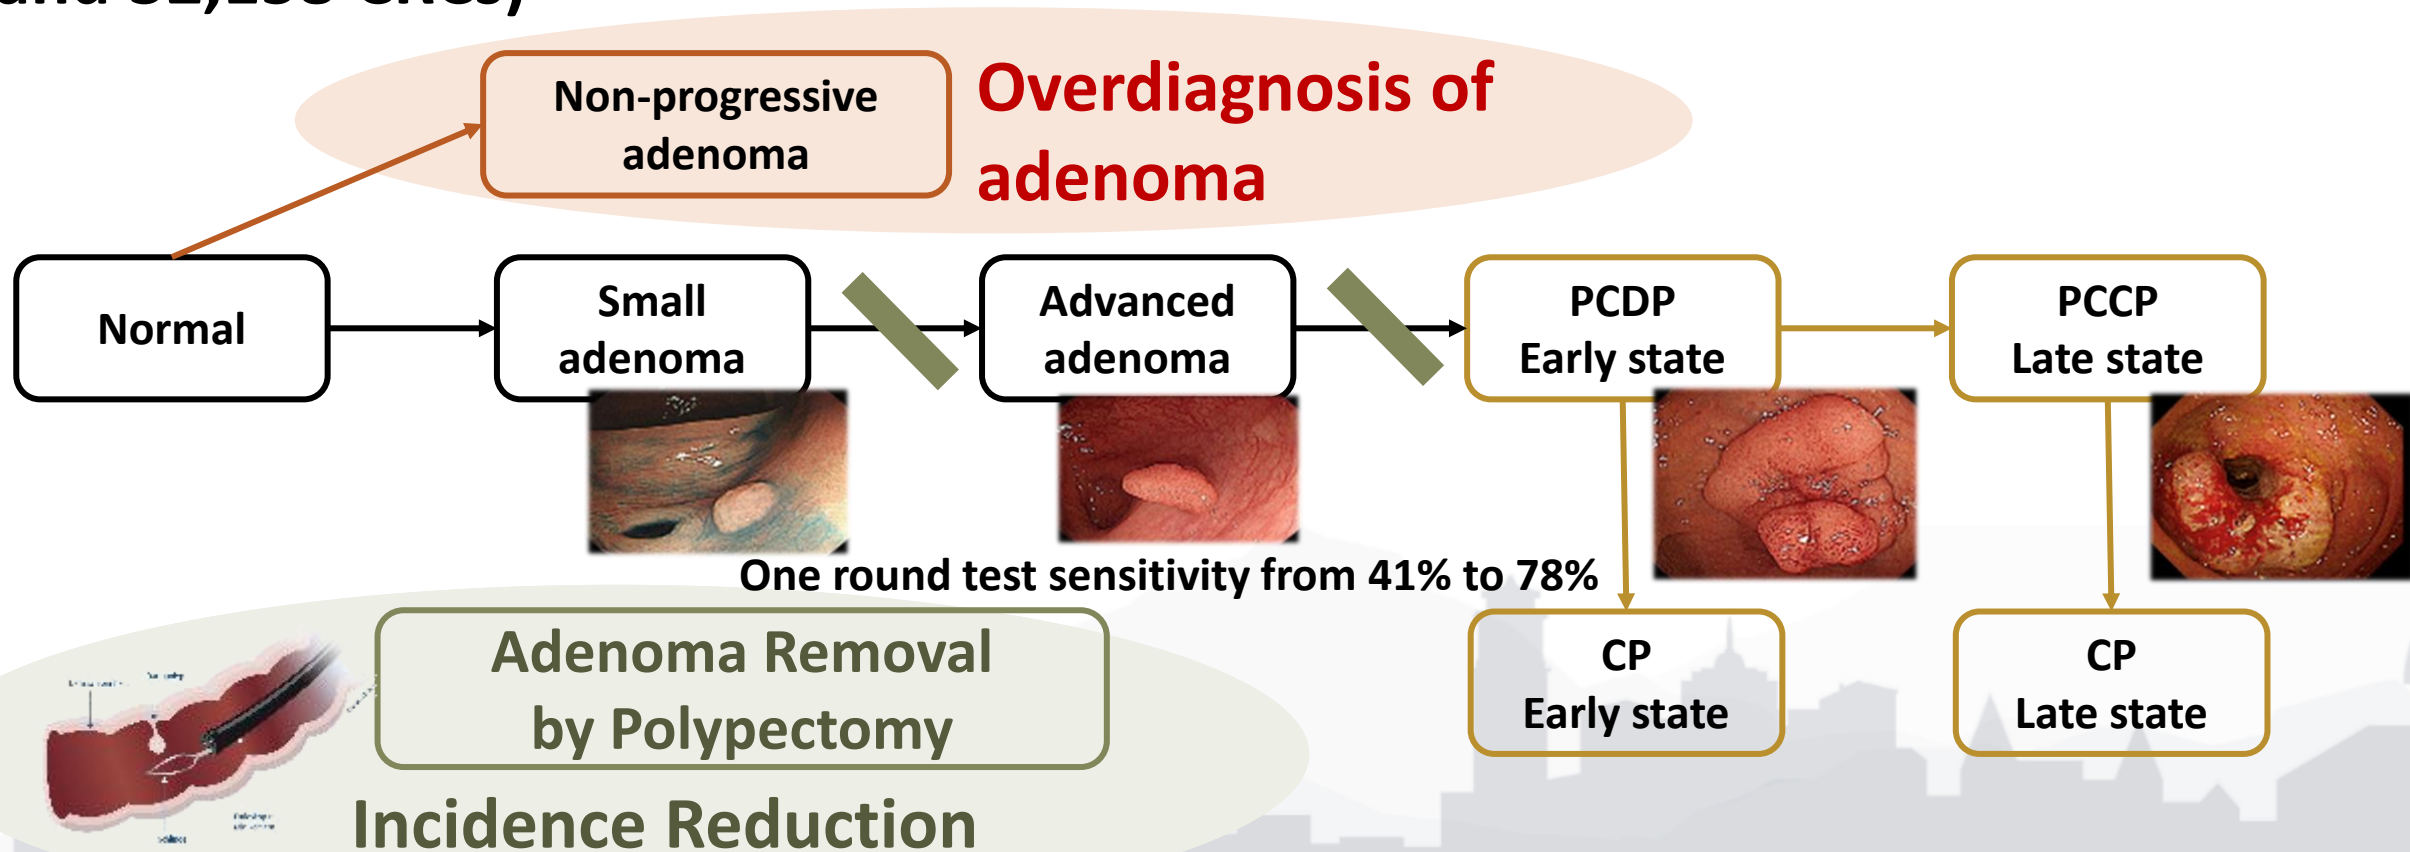

Digital Twin Design for FIT service screening

Infrastructure of Natural History Model for Deciphering Incidence Reduction and Overdiagnosis

- Data source: Taiwan Nationwide CRC screening (n=5,417,699)
- Period: 2004-2018 cohort (follow-up until 2021 to ascertain 144,028 adenoma and 32,158 CRCs)

Impacts of Inter-screening Interval on Incidence of CRC and Overdetection of adenoma

Reducing Colorectal Cancer Incidence with FIT Screening by 22% for young people aged 40 to 49 yrs

Reference group: No Screen

Eligible population

Annual

Biennial

Taiwan Program

Triennial

Incidence Reduction

35%

33%

31%

Advance Cancer Reduction

44%

42%

39%

Overdiagnosis of Adenoma

46%

32%

25%

From Universal Population-based to Precision Colorectal Cancer Screening

The fHb-based multistate risk model for precision colorectal cancer screening

The fHb-based risk profile (compared to faecal Hb concentration below 50 ng/mL) by multistate colorectal neoplasia

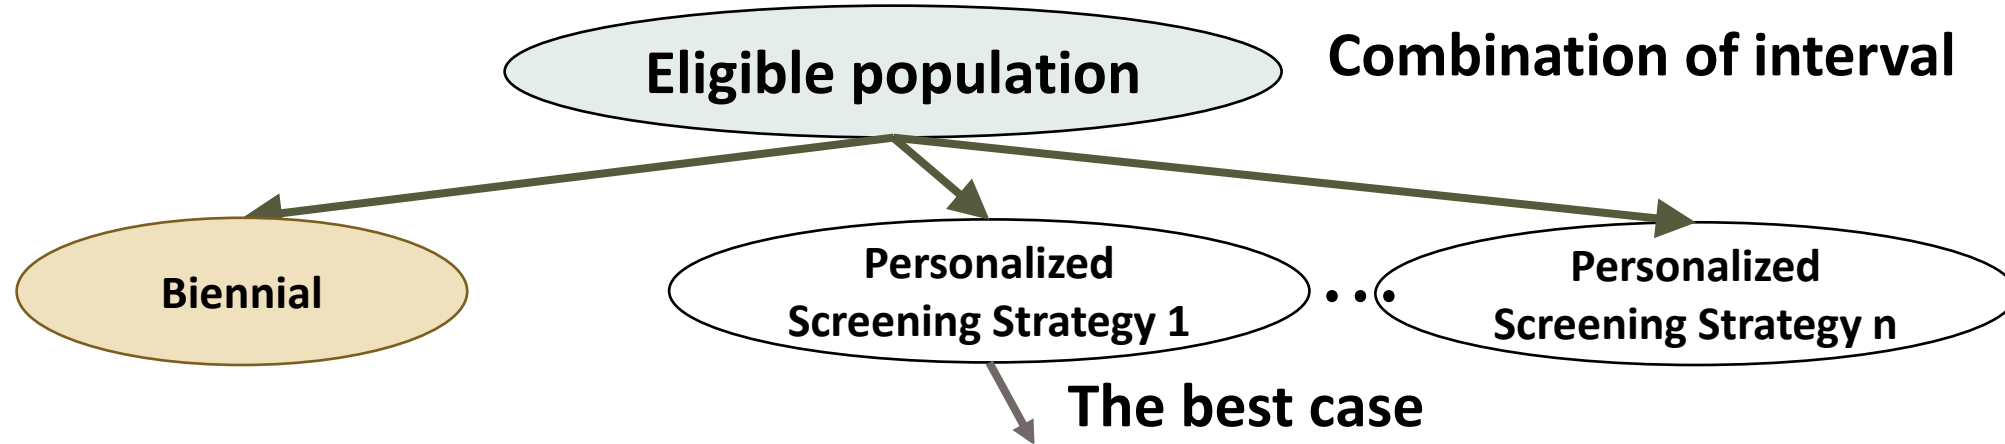

OR

Personalized Screening Strategies by the f-Hb calibrated multistate risk model

Digital Twin Approach

Low-Risk Group

High-Risk Group

faecal Hb concentration (ng/mL)	Inter-Screening Interval
0-50	6
50-75	3
75-100	3
100-250	2
250-500	1
500+	0.5

Personalized Screening Strategy of Reducing Over- detection of Adenoma and Unnecessary Screening Utilization

Digital Twin Approach

**Overdiagnosis
of Adenoma
(Reduction)**

32%

12%

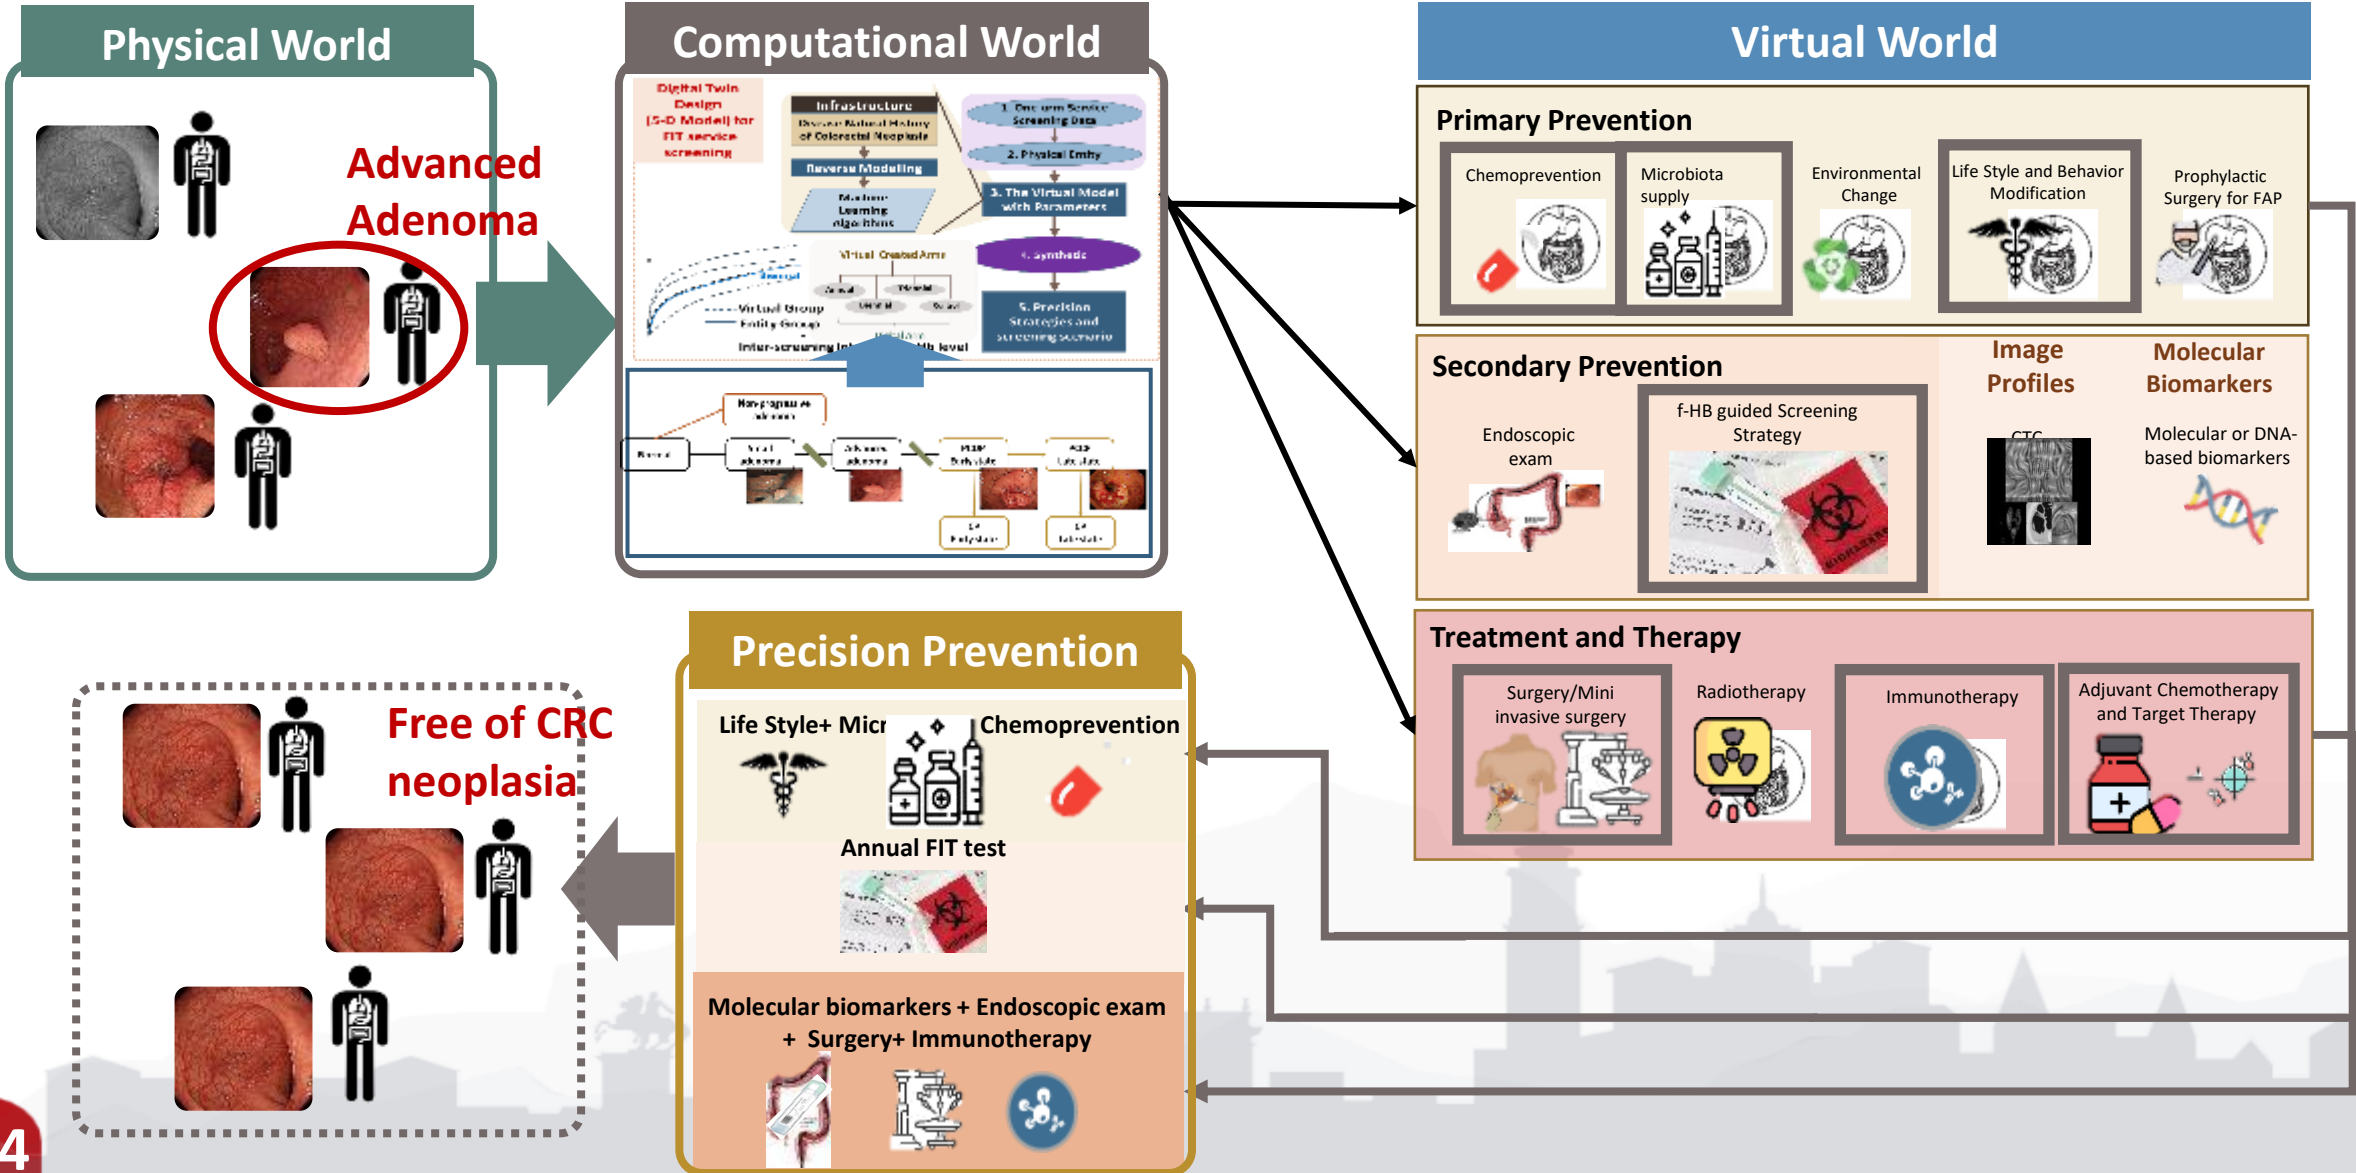

(20%)

Reduction of
Screening
Utilization

Reference
group

FIT tests: 39%
Colonoscopy: 35%

Perspective Digital Twin Design from Primary to Tertiary Prevention

- **Precision FIT screening with f-Hb-calibrated model not only reduces incident CRCs but also avoids colorectal adenoma over-detection as well as unnecessary FIT tests and colonoscopies.**
- **The Digital Twin Approach provides an efficient means for evaluating precision population-based FIT CRCs.**
